MODELING AND SCENARIO RECAP

Patrick Maguire

Director of Resource Planning

MODELING ASSUMPTIONS

- Solar Capacity Credit: re-calibrated capacity credit to reflect capacity contribution for tracking solar, which is higher than fixed tilt and rooftop. Capacity contribution validated by IPL tracking solar historical data
- Updated modeling constraints around new resources
- Releasing aero and recip capital costs, battery storage costs and operating characteristics
- Added 1x1 CCGT in 2034 in all portfolios: firm, dispatchable capacity on IPL's 138 kV system required with Harding Street Steam 5-7 retirements; final technology solution to be determined at a later date, but CCGT simply used as placeholder for now

CAPACITY EXPANSION

Stochastic Capacity Expansion

Portfolios optimized across a wide range of futures with dynamic commodity prices, load shapes, and renewable profiles through time and across iterations

KEY HIGHLIGHTS FROM CAPACITY EXPANSION RUNS

- Renewables being selected first, with storage and gas technology filling in remaining shortfall
- Small variations in capacity expansion between carbon tax and no carbon tax case because of model preference for renewables in both cases
- Results led IPL to determine fewer candidate portfolios stressed across range of scenarios better than assessment of more portfolios with slight variations

OBSERVATIONS AND TAKEAWAYS

- Clear that a high renewable future is expected in next 10-15 years: just a matter of timing and scale
- Studies from MISO indicate increased complexity of renewable integration as renewable energy share moves past 30%
- Level of IPL wind and solar build will change through time as company and industry work to solve issues and develop new modeling capabilities
